THE SIMPLE VERSION

How your RDR rating works

A friendly, no-maths guide for everyone at the club.

01 What is it?

Your RDR is your skill rating at the club: one number, usually between 2 and 8. The higher the number, the stronger the player — and everyone's on the same scale.

2 — 8
NEWER — STRONGER

02 It's all about results

Your rating comes purely from your games — who you played and how you did. No opinions, no committee, no favourites. Just what happens on court.

03 Win up, lose down

Every game gives your rating a little nudge. Win and it ticks up, lose and it dips. Play regularly and it settles at your real level.

▲ WIN | ▼ LOSE

04 Who you beat matters

Beat a stronger player and your rating jumps more. Lose to someone you'd usually beat and it costs a bit more. Beating much weaker players barely moves it.

05 It's a team game

In doubles, your team's strength is you and your partner combined. A win with a weaker partner against a strong pair is worth more — you carried more of the load.

06 The score counts a little

A comfy win nudges you a touch more than a nail-biter, and a heavy defeat stings a little more. But winning is what matters — no need to run up the score.

07 New players settle in

Just joined? Your rating takes a few sessions to find its level. Early games move it more while it's getting to know you, then it steadies down.

08 It updates every session

After each club night's results go in, everyone's rating recalculates automatically. Check the leaderboard to see where you've landed.

09 It's your club's own rating

RDR is built from your club's own games — it reflects how you do *here*, against the people you actually play. It's separate from DUPR (a global rating); you don't need a DUPR to have an RDR.

Play often, play anyone, and let your rating tell your story.

RDR = RALLY DOUBLES RATING

UNDER THE HOOD · OPTIONAL

For the curious 🔧

Happy with the simple version? You can stop here — that's all you need. But if you like knowing how things tick, here's what's quietly going on behind your number. Still no maths, promise.

🔮 Expected vs actual

Before each game, the system works out the result it would **expect** from the four ratings — a stronger pair is expected to win, and roughly by how much. Your rating then moves on the **gap** between what was expected and what really happened. A result that goes to form barely moves anyone; a genuine upset moves everyone more.

⚖️ It's a fair swap

Rating is shared, not invented. Whatever the winners gain, the losers give up by the same amount. So the club's ratings stay balanced over time and don't quietly drift up or down for everyone.

📏 How big the move is

Two things size each change: how **surprising** the result was, and how **settled** your rating already is. Newer or less-active players have a less certain rating, so theirs moves faster; long-standing players move in smaller, steadier steps.

🎯 Confidence grows with play

Behind your number, the system also tracks how sure it is of it. The more you play — and the more varied your opponents — the more confident and stable your rating becomes. That's why your first few sessions feel swingy and later ones don't.

🤝 Teams and margins

A team's strength is the average of its two players' ratings, and the winning margin feeds in too — but it's **capped**. An 11–0 thrashing doesn't count wildly more than a solid 11–4, so blowouts can't dominate.

🌱 Where new players start

A brand-new player begins from a sensible starting estimate — or from the level of the players around them in their first games. Their real rating then emerges naturally over those opening sessions.

🔥 **The short version of all that: it's fair, it's balanced, and it always weighs the result against who was on court. Just keep playing — your rating takes care of itself.**
